Product Details

The coated frontlit PVC banner of the technology produced by DERFLEX is a knife coating process. In general, the weaving of the base fabric, the preparation of the raw materials of the PVC coating, the control of the production process is a key factor in the quality of the blade coating product. As the base fabric determines the strength of the product, and the blade coating production speed is faster, wide format. The preparation of the slurry directly determines the vast majority of the product's performance, so it constitutes a key technology of the blade coating process. We have an advanced knife scraping PVC coating production line, with professional technical staff to ensure that our product quality.

Main advantage of DERFLEX PVC coated frontlit banner products:

1. Good ink absorption
2. High tear and tensile strength;
3. Good weather ability
4. long outdoor life durance.

Most popular items:

DD1188: 1000D*1000D, 18*18, 510gsm

DD1188: 1000D*1000D, 18*18, 440gsm

DD1166: 1000D*1000D, 16*16, 440gsm

Q&A:

Q: We are distributor, we want hard tube with logo printed.

A: Please send me logo you want to be printed on the tube.

Q: Most China products, we can see fabric out on the edge of the banner.

A: We would make super smooth edge of the material. You can come to our factory to see how we process.

Q: For different material, why are they with different picture performance when we use the same printer?

A: The ink curve on your plotter printer need to be adjusted for different material.

You are welcome to visit our factory for further discussion.
